

Patient Feedback & Complaint Escalation Workflow

System Design - Architecture Overview

1. System Purpose

This workflow supports healthcare organizations in collecting patient feedback, recording submissions, analyzing feedback with AI, sending appropriate patient responses, and escalating complaints that require human attention.

2. System Architecture

3. Main Components

Component	Role
Feedback Form	Collects the patient's submitted feedback and relevant information.
n8n	Orchestrates the workflow, routing, email actions, records, and escalation.
Google Sheets	Maintains centralized feedback records for tracking and review.
AI / LLM	Analyzes the feedback and supports positive or negative routing.
Gmail	Sends the appropriate automated response to the patient.
Slack	Notifies the team when a complaint requires human attention.

Patient Feedback & Complaint Escalation Workflow

Process Map - Positive & Negative Feedback Routing

1. End-to-End Process

2. Human Oversight

AI supports feedback analysis and routing, but it does not resolve complaints or make final decisions. Complaints requiring attention are escalated to the healthcare team, which remains responsible for review, investigation, follow-up, and resolution.

3. Privacy & Public Documentation

Patient feedback can contain sensitive information. Public demonstrations and project documentation should use fictional or test data only. Real patient information, medical records, credentials, API keys, and authentication tokens should not be included in public project materials.
